

Galaxy One Nail System

Nail Tip Application Procedure

Galaxy One is the next step in the acrylic nail evolution. Fast setting and primerless in four vibrant to subtle pink and white combinations!

This is a new product, please read instructions carefully.

Sanitise

Always sanitise yourself and your client before starting any service. **Scrape the skin membrane from the nail.**

Step 1: Etch

Using the **Black Skinnie File**, etch the nail plate from North to South. Etching must scratch the nail surface (this procedure is not removing oil or the shine). Do not use a fine buffer to etch, the use of a buffer directly onto the natural nail will cause irreparable harm. It will remove the top layer of the nail and cause thinning.

Step 2: Dust

Remove all dust and debris from the nail plate using a nylon manicure brush.

Step 3: Balance

Use three squirts (or brush-ons) of **Balance** on each nail and allow to dry between. **Balance** will bring the pH level closer to the acrylic pH level and increase adhesion.

Step 4: Fit Nail-tips

Glue the tips onto all 10 fingers. Use a manicure stick to remove glue from the underside taking care that the nail tip is not lifted. Blend the ridge line until the natural and plastic surface match and then file and shape the nails. Roughen the surface slightly.

Step 5: Apply the Product

Before applying product, lightly moisten the nail plate with your monomer. This will increase adhesion. Use caution near the skin. **Using a wet, NOT RUNNY** consistency, apply white powder to the free-edge, pat to shape. Then apply a small ball of pink powder at the cuticle area. Pat into place and stroke downward to blend. Place second pink ball between the cuticle ball and the free edge and pat the two pink balls together, stroke to blend.

Step 6: File

Using the **Brown Skinnie File**, file the sides and free edge on all ten nails. Then shape the top surface being sure to smooth out the cuticle area. Next, use the **Grey Skinnie File** to smooth and finish.

Step 7: Buff and Oil

Buff the nails using a **Terminator** being sure to remove all scratches. Rehydrate your client's cuticle using **Galaxy Almond Oil**. Next have your client scrub using a pre-sterilised nylon manicure brush to remove excess oil and debris.

Step 8: Liquid Glass

Apply 2 coats of **Liquid Glass** over a pink and white enhancement. **Liquid Glass** has UV inhibitors, a sunscreen for the nails to prevent yellowing. **DO NOT** use **Liquid Glass** as a base coat, or a top coat for Nail Polish.

Step 9: Smudge-me-not

Apply 2 coats of **Smudge-Me-Not**. A UV inhibiting topcoat to be applied over **Liquid Glass** to prevent stickiness caused by sunscreens, suntan lotions etc. Also a perfect quick dry topcoat for nail polish.

Notes...

The *Galaxy Nails One System* is virtually primerless. Primer can be used when preferred or necessary.

Liquid Glass is the best topcoat to use for finishing a pink and white enhancement. *Liquid Glass* contains UV inhibitors and acts like a sunscreen for nails. Not to be used as a base or topcoat for nail polish.

Smudge-me-not can be used to finish over liquid glass or nail polish, it is non-yellowing and dries in under 3 minutes. This is a protective coating to prevent stickiness from sunscreen, hair products and perfume.
